MRI PATIENT SAFETY SCREENING

Question	Answer
Pacemaker, defibrillator, neurostimulator	No
Aneurysm clips, cochlear implant	No
Metal fragments in eyes or body	No
Pregnant or possibly pregnant	No
Prior spine surgery	No
Prior spine MRI	No
Claustrophobia	Mild - declined sedation
Referring provider	Attorney referral (per patient)
Reason for exam	Low back pain after car accident 3/3/26

Dana Linacre

MRI LUMBAR SPINE WITHOUT CONTRAST

Patient: Dana M. Liriacre DOB 06/14/1987

Date of exam: 05/21/2026

CPT: 72148

Clinical history: Low back pain following motor vehicle collision 03/03/2026.

Technique: Multiplanar, multisequence MRI of the lumbar spine without contrast, 1.5T.

Comparison: Lumbar radiographs 03/03/2026 (report only).

Findings

Alignment: Normal lumbar lordosis. No spondylolisthesis.

Vertebrae: Vertebral body heights are maintained. No fracture. No marrow edema. Bone marrow signal is otherwise normal.

Conus: The conus medullaris terminates at L1 and is normal in signal.

T12-L1 through L3-L4: No disc herniation, central canal stenosis or neural foraminal narrowing.

L4-L5: Broad-based posterior disc bulge measuring up to 3 mm, with a small central annular fissure (high-intensity zone). Mild bilateral facet arthropathy. Mild bilateral neural foraminal narrowing, left slightly greater than right. No central canal stenosis.

L5-S1: Disc desiccation with mild loss of disc height. No focal disc herniation. Mild bilateral facet arthropathy. Neural foramina are patent.

Paraspinal soft tissues: Unremarkable.

MRI LUMBAR SPINE WITHOUT CONTRAST (continued)

Impression

1. L4-L5 broad-based disc bulge with a small central annular fissure and mild bilateral neural foraminal narrowing, left greater than right.
2. Mild degenerative changes of the lower lumbar spine, with disc desiccation at L4-L5 and L5-S1 and mild facet arthropathy.
3. No acute fracture or marrow edema.

Electronically signed: Lionel Brascombe, MD, Diagnostic Radiology 05/21/2026 16:42
