INITIAL EXAMINATION REPORT - 03/07/2026 (page 1 of 4)

History

Ms. Linacre is a 38-year-old right-handed female dental office manager who presents 4 days after a motor vehicle collision on 03/03/2026. She was the restrained driver, stopped at a red signal, when her vehicle was struck from behind by a pickup truck. She reports her head was thrown back into the headrest. She was evaluated the same evening at Saltmarsh Regional Hospital where CT of the cervical spine and lumbar X-rays were negative for fracture, and she was discharged with a muscle relaxant and anti-inflammatory.

She presents today with constant posterior neck pain rated 7/10, with stiffness and pain on left rotation, and headaches 3 to 4 times since the accident. She reports low back pain rated 8/10, aching and sharp with bending, aggravated by sitting at her desk longer than 30 minutes and by getting in and out of the car. She denies radiating pain, numbness or tingling. Sleep is interrupted 2 to 3 times nightly.

Past history: She denies prior neck or low back complaints or prior chiropractic care. Surgical history tonsillectomy.

Medications: cyclobenzaprine, ibuprofen, oral contraceptive. No known allergies.

INITIAL EXAMINATION REPORT (page 4 of 4)

Assessment

Acute cervical and lumbar sprain/strain with associated myospasm and post-traumatic headache following a rear-impact motor vehicle collision. Based on the history, the mechanism of injury and the examination findings, it is my opinion within a reasonable degree of chiropractic probability that the patient's injuries are causally related to the motor vehicle collision of 03/03/2026.

Plan

- Chiropractic manipulative therapy, cervical, thoracic, lumbar and pelvic, 3 times per week for 4 weeks, then re-evaluate.
- Manual therapy, therapeutic exercise, electrical stimulation, mechanical traction and hot/cold packs as indicated.
- Home care: ice, posture at workstation, avoid lifting over 15 lb.
- Re-examination in 30 days. Advanced imaging if the low back fails to respond.

RE-EXAMINATION (page 2 of 3)

Assessment

Cervical sprain/strain responding well to care. Lumbar sprain/strain improving but slower to respond, with persistent lumbar paraspinal spasm and painful Kemp's on the left.

Plan

- Reduce frequency to 2 times per week for 4 weeks.
- Re-evaluate in 30 days. If the lumbar complaints plateau, refer for lumbar MRI and orthopedic consultation.
- Continue home exercise program, workstation adjustments.
- Next appointments scheduled: 04/13/2026 and 04/15/2026.
